Project	Script-Controlled ACL – Restrict Record Access Based on Field Value
Team Leader	Keerthika D
Team Members	losana S, Hema Priya M, Gokul
Date	15-10-2026

Selected problem: Restrict institution-record access using user roles and the Branch field, while preserving administrator access.

Idea	Description	Priority
Role-based ACLs	Require the appropriate custom role for each operation.	High
Branch condition	Set the Read ACL data condition to Branch is EEE.	High
Administrator exception	Allow administrators full access as specified in the lab script.	High
Separate operation ACLs	Configure Read, Create, Write and Delete independently.	High
Impersonation testing	Test EEE user, user without required roles, and administrator.	High
Audit and documentation	Record expected access behavior and actual test outcomes.	Medium

Idea Prioritization

Highest priority is to combine role requirements with the Branch is EEE read condition, then configure separate Create, Write and Delete ACLs. Verify both allowed and denied access.

Initial acceptance check	Expected result
EEE user with required read role opens EEE records.	EEE records are visible according to the configured ACL.
User without required role opens the list.	Access is denied.
Administrator opens records across branches.	Administrator retains full access.
User attempts Create, Write or Delete without the corresponding role.	The operation is denied.
