Project	Script-Controlled ACL – Restrict Record Access Based on Field Value
Team Leader	Keerthika D
Team Members	losana S, Hema Priya M, Gokul
Date	15-10-2026

Project Overview

This project demonstrates how ServiceNow ACLs protect records by checking roles and, for reading, a Branch condition. It uses a custom Institution Details table and separates read, create, write and delete permissions.

Objectives

• Create the test user, roles, table and fields.
• Limit record reading using bb1 and the Branch is EEE condition.
• Configure Create, Write and Delete ACLs with bb2, bb3 and bb4.
• Verify behavior by impersonating different users.

Advantages

• Helps prevent unauthorized record viewing or modification.
• Separates permissions by operation.
• Makes access behavior easier to verify and document.
• Preserves administrator access as specified.

Limitations

• Incorrect ACL settings may block valid work or expose records.
• Actual screenshots and measured performance data were not included in the source brief.
• Test outcomes must be filled in after performing the lab.

Conclusion

The project demonstrates role- and field-based access control in ServiceNow. The final submission should include completed configuration, screenshots and actual functional/UAT results.

Appendix – submission checklist

■ FSD reviewed ■ ACL settings documented ■ Test cases completed with actual outcomes
■ Screenshots attached ■ Issues and resolutions recorded ■ Team details checked
